

COPLAS CASE STUDY

Coplas Expands Office Capacity
Inside an Active Manufacturing
Facility

SCAN TO VIEW FULL CASE STUDY

Overview

The Safety Source partnered with Coplas to expand office capacity within its active Sterling Heights manufacturing facility. A two-story Panel Built modular in-plant office maximized available vertical space, creating dedicated workspace close to production without requiring a building expansion.

Challenges

Coplas needed additional enclosed office capacity inside its Sterling Heights, Michigan manufacturing facility, which supports GMC Sierra bumper assembly. The solution had to place employees close to plant operations while making efficient use of valuable floor space and fitting naturally into an active industrial environment.

Solution

The Safety Source provided Coplas with a two-story Panel Built modular in-plant office that captures vertical space and creates dedicated work areas directly within the GMC Sierra bumper assembly operation.

Results

- Coplas gained additional enclosed workspace supporting its GMC Sierra bumper assembly operation without extending the building footprint.
- The office positions employees close to manufacturing activity while providing separation from the plant floor.
- The modular approach supports long-term flexibility as operational needs evolve.
